**Take Care Today.
Better Health Tomorrow.**

Lung cancer is the leading cause of cancer deaths in the United States.

Increase the Chances for a Cure.

Early diagnosis of lung cancer is critical to saving lives from this deadly disease. The earlier lung cancer is detected, the better the chances for successful treatment and possible cure. When detected and treated in the earliest stage, lung cancer survival may be as high as 70%.

Unfortunately, lung cancer can grow undetected for many years before it causes symptoms.

But now there's hope. Our lung scan can identify lung cancer six times earlier than a conventional chest x-ray.

Your Lung Scan.

Our state-of-the-art CT scanner from Siemens Medical Solutions takes hundreds of images of your chest in a matter of minutes. Multiple images are obtained during one breath-hold.

Prior to the test you will be asked to fill out a brief health questionnaire to assess your risk for lung disease. This test is completely painless and effortless.

Your Results.

After your scan, a specially trained radiologist will read and interpret your lung scan. If an abnormality is found, you will be advised to follow up with your physician or a lung specialist.

After your visit, you and your personal physician will receive a detailed written report of the findings and any action recommended. You may also receive a CD-ROM containing all of your images for future reference.

Who Should Consider a Lung Scan?

Although lung cancer can occur in anyone, it is predominantly seen in former or current smokers, those who have been exposed to second-hand smoke, or those exposed to occupational hazards, such as toxic fumes or asbestos. People who have a family history of lung disease and/or are experiencing symptoms such as coughing, shortness of breath, wheezing or chest pain may also be candidates for this test.
